

## **The Golden Mean of CPUs: E5-1650**

At Castlegem, we are constantly looking to improve our service matrix for our valued clients. We are therefore excited to announce a new range of dedicated server hosting hardware, available immediately: Intel's E5-1650 based server range.

For those clients who want to squeeze even more out of their server than an E3 will be willing to give, but who are not (yet!) into Dual E5-26xx servers, we have made the new E5-1650 server available.

Its 6 cores and 12 threads give ample performance for even very demanding applications, supporting a multiple of physical memory compared to the E3's – up to 375GB of memory – and a memory bandwidth that is nearly double the E3's.

The entry level machine comes with 16GB of memory and 2 enterprise SATA disks – both memory and disks can easily be upgraded up to the maximum memory possible and/or up to 4 hot swap disks of our clients' choice!

Plans start from just £ 450 net per quarter, an as yet unrivalled offer in the industry!

**Castlegem: *Enterprise performance for the community.***
