

Enterprise DNS for the Pros

Castlegem has recently started a cooperation with GBSHouse – Rage4 to support their distributed global DNS service.

The operation of a fast, stable, reliable, resilient and redundant domain name service is key to any ISP's operations. With Rage4 finding its way into the product range offered with virtual private server and dedicated server, clients of Castlegem now have the option to take a step further in maintaining their domain names, compared to other domain name control panels.

Castlegem will also be developing a WHMS module to implement all Rage4 functionality directly, using the API provided by Rage4.

Ashburn Virtual Private Server – SSD backed

Further to our Rage4 partnership, we are pleased to announce that we are now offering enterprise class virtual private server systems based on SSD technology. In combination with our superb connectivity in terms of speed, latency, and redundancy, this offers our primary client base – our trader community – an ideal setup to run their trading platforms off our East Coast point of presence.

Clients will be convinced of the outstanding performance of the E3-1230v2 CPU along with the RAID backed Intel 520 SSD array. KVM as virtualisation technology, with virtio enabled, rounds off the enterprise packages available now – offering several hundred MB/s sequential write speeds as well as over 40,000 iops both read and write each.

Plans start from as low as £4 per month!

Castlegem: *Enterprise performance for the community.*
